**Re: Follow-up to Recommendation to Sample Yellow Haze at Diavik**

Dear Gord,

On March 6, 2020, EMAB recommended to Diavik that they “**Sample the yellow haze and report on its chemical make up and concentration, or develop a program to sample it**” (recommendation DDMI-EAQ-15). In their May 4 reply, Diavik noted that they have not observed this haze over the mine.

The attached photos show visible haze over the mine. The photos are taken from the Ekati mine site, looking towards the Diavik mine. It has also been noted that the yellow haze is more often seen in winter months.

EMAB notes that **Recommendation-DDMI-EAQ-15** still stands, and we request that Diavik please re-address the recommendation.

Please send any questions to John McCullum at the EMAB office. We look forward to receiving your response to this letter within 60 days.

Sincerely,

Charlie Catholique, Chair
